(54) SYSTEM AND METHOD FOR CONVERTING WIRE CONTENTS INTO WIRELESS CONTENTS IN REAL TIME

(57) Abstract:

PURPOSE: A system and a method for converting wire contents into wireless contents in real time are provided to convert conventional HTML wire contents data into wireless language data and into a wireless language requested by a client in real time without a special operation.

CONSTITUTION: URL(Uniform Resource Locator) information, page number information, pattern information, HTTP(Hyper Text Transfer Protocol) method information, and output style information are received for preparing a wireless data creation(501). A pattern is created based on the URL(502). HTML(Hyper Text Markup Language) source data are transmitted from a corresponding URL(503). A parse-tree is created based on an HTML source(504). The created pattern information is received and the pattern stored in a server is loaded on a memory(505). The parse-tree data and the pattern information are inputted, and output data are extracted for creating wireless data(506). Wireless data are created based on the created output data(507). The created output data are transmitted to the client(508).
